                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             antibodies. Using the fact that human cells that express only 1-plastin are haemopoetic cells, and human cells that express both 1-plastin and t plastin are neoplastic, the above probes and antibodies could be used to distinguish between the above cell types. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 22 BP; 1 A; 18 C; 1

                                                                                                                                                                        The oligonucleotide AAQ86634 is a non-promoter primer for the CML major breakpoint amplification region. It is used to illustrate that small changes in the NA sequence result in large changes in the amplification efficiency .AAQ86634 is capable of serving as a primer for the synthesis of autocatalytic oligonucleotides which require no change in the PCR conditions i.e.constant temperature, pH and ionic strength. This sequence is useful in generating multiple copies of specific nucleic acid target

They are used to produce autocatalytic oligonucleotides which require no change in the experimental conditions i.e.constant temperature, pH and ionic strength. These sequences are useful in generating multiple copies of specific nucleic acid target sequences. (Updated on 25-MAR-2003 to correct PF field.)

The method comprises combining the target with a primer which hybridises to the 3'-terminal portion of the target, a promoter primer which hybridises with a portion of the DNA primer extension prod., reverse transcriptase, RNase H and transcriptase. It can be used as a component of an assay to detect and/or quantitate specific target sequences in clinical, environmental or forensic samples. It also has the advantages of being autocatalytic, using the cooperative action of a DNA polymerase, e.g. reverse transcriptase and avoids repetitive manipulations of reaction conditions, e.g. temp., ionic strength and pH. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Auto-catalytic synthesis of multiple copies of an RNA target sequence - uses cooperative action of a DNA and RNA polymerase in presence of RNase H, useful for detection of target sequence e.g. in clinical or environmental sample.
                                                                                                                                                                                                                                                                                                                                                                                    HIV; probe;

The kits comprise two amplification primers (such as AAT40182), and a probe (such as AAT42404) for detection of the amplified sequence. By using these sequences, the amplification of HIV nucleic acid sequences is improved. The kits can also be used for the detection of other microorganisms, by using different probe sequences. Other sequences that can be detected using this method include those from HBV (using the sequences shown in AAT42410-T42412), and BCL-2 (using AAT42413-T42416). The samples can be clinical, environmental or forensic samples, and the method produces large amounts of the target sequence for a variety of uses. The method can also be used to produce multiple copies of a target sequence for use in cloning, and sequencing, and to produce probes for the target sequence. (Updated on 25-MAR-2003 to correct PF field.)

```

Primers AAX83071-X83082 were used to PCR amplify, detect and identify mutations in the human WRN gene (AAX83003) which encodes a protein related to Werner's syndrome. The products can be used for the detection and treatment of Werner's syndrome (WS), an autosomal recessive disorder

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This RT-PCR 5' primer is designed to a human breakpoint cluster region (BCR) and is used in a novel method of preparing drug-resistant, non-malignant haematopoietic cells. This method involves the construction of a new expression cassette comprising a first nucleic acid molecule which encodes resistance of a host cell to a cytotoxic agent, operably linked to a first promoter which functions in the host cell and a second nucleic acid molecule operably linked to a second promoter which functions in the host cell. The second nucleic acid molecule operably linked to a second promoter which functions in the host cell. The second nucleic acid molecule on a nucleic acid molecule or a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            polypeptide whose expression decreases the expression of an RNA or a polypeptide present in a malignant cell only. This method can eliminate residual neoplastic disease in a patient, where the disease has an immature hematopoietic progenitor cell with a well-defined gene rearrangement. Diseases such as chronic myelogenous leukaemia which is associated with a BCR/ABL gene rearrangement, acute lymphoblastic leukaemia and acute promyelocytic leukaemia may be treated using this
                                                                                                                                  Primer BB300b for bcr2-abl2 and bcr3-abl2 translocation regions
                                                                                                                                                                        25-MAR-2003

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC AAT91749-T91763, and AAT91765-T91792 are primers used in the method of CC the invention. AAT91754-T91759 can also be used as capture CC also be used as detector agents. The method of the invention is for CC detecting or monitoring chronic myelogenous leukaemia (CML) cells in a CC human patient. The method comprises obtaining RNA from haematopoietic CC cells of the patient, and amplifying it using a pair of primers that CC amplify both the bcr2-abl2 and bcr3-abl2 translocation regions. The CC amplified sequence is contacted with a capture agent comprising a capture CC amplified for the bcr2-abl2 and bcr3-abl2 translocation regions. The CC mixture is contacted with a capture mixture. The capture ON is CC specific for the bcr2-abl2 and bcr3-abl2 translocation regions. The CC mixture is contacted with a solid phase is washed, then contacted with a CC detector agent comprising a detector ON specific for the bcr2-abl2 or bcr3-abl2 translocation regions and a label. The amount of labelled CC detector ON bound to the solid phase is then correlated with the presence CC or quantity of CML cells in the patients. It can also be used prognostically to assess cytogenetic remission in patients with CML. The method detector contacted with contacted with the bcr3-abl2 translocations associated with CML. The method detect CML in the absence of the ph chromosome, nor CC does it detect acute lymphotrophic leukaemia (ALL) even if the ALL cc field)
                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This primer is used for the PCR amplification of an exon of the human CC calcium ion channel alpha 1 subunit. The channel is related to familial CC hemiplegic migraine (FHM) and/or episodic ataxia type 2 (EA-2) and is CC derived from, related to or associated with a gene present in humans on CC chromosome 19p13.1-13.2. The encoding nucleic acid can be used to CC localise or identify genes related to episodic neurological disorders, CC specifically migraine, FHM or EA-2, but also epilepsy. It can also be CC used to distinguish between alleles of the corresponding gene. Cells and CC animals containing recombinant expression vectors comprising the nucleic acid can be useful in study, development and treatment of migraine, FHM, CEA-2 and epilepsy. Proteins or peptides encoded by the nucleic acid and CC diagnose FHM, EA-2, migraine and other neurological conditions associated CC with cation channel disfunction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches 17;

Mutations of the HNF-4 alpha gene have been identified by amplifying (see AAV52665-86) and sequencing the appropriate exon. The invention concerns the identification of genes responsible for non-insulin dependent diabetes mellitus (NIDDM) for use in diagnostics and therapeutics. It demonstrates that the MODY1 (maturity-onset diabetes of the young) locus is the HNF-4 alpha gene. Analysis of mutations in the HNF-4 alpha gene can be diagnostic for diabetes
                                                                                                                                   New nucleic acid encoding Ikaros protein involved in differentiation of lymphocytes - existing in several related products, used to treat e.g. immune diseases control cell differentiation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Bell GI,

This oligonucleotide from the T cell receptor delta enhancer was identified as a potential high affinity binding site for Ikaros \cdot

proteins

AAV66352-55 represent CML-2 chromosomal translocation t(14;18) major breakpoint amplification region non-promoter primers. The primers are used to exemplify the invention. The specification describes methods o synthesising multiple copies of a target nucleic acid sequence autocatalytically under conditions of substantially constant temparatu ionic strength and pH are provided in which multiple RNA copies of the target sequence autocatalytically generate additional copies. The targe sequence is a block splice template which comprises two nucleic acid regions. The first region is located 3' of the second region and is blocked at its 3' terminus to inhibit primer extension to the conditional copies.

temparature,

It includes the core motif GGGAA found in consensus recognition sequences for murine Ikaros protein isoforms mIk-1, mIk-2 and imIk-3 (see AAV52830-32). High affinity binding sites for Ikaros have been found in enhancer and promoter regions of the regulatory domains of the TCR antigen complex, the CD3 genes, the SL3 and HIV long terminal repeat and in the regulatory domains of other T cell restricted antigens (see AAV45358-402) by gel retardation assay. Ikaros is involved in early differentiation of lymphocytes. The invention provides Ikaros mucleic acids (see AAV42805-11 and AAV42840) and polypeptides, vectors and host cells. These are used to treat T and B cell diseases, to control expression of heterologous genes placed under control of an Ikaros responsive element, to treat nervous system diseases and to modulate cell division, amplification or differentiation, especially in haematopoietic cells.
                                                                                                                                                                             Block splice template useful for amplification of nucleic acids - comprises two nucleic acid regions, the first region located 3' of the second region and blocked at its 3' terminus to inhibit primer extension
                                                                                                                                                                                                                                                                                                                                                                                                                                                             CML-2

                                                                                                                                                                                                      AAV66349-50 represent CML-2 chromosomal translocation t(9;22) primers, for the (+) and (-) strands respectively. The primers are used to exemplify the invention, together with probe AAV66351. The specification describes methods of synthesising multiple copies of a target nucleic acid sequence autocatalytically under conditions of substantially constant temparature, ionic strength and pH are provided in which multiple RNA copies of the target sequence autocatalytically generate additional copies. The target sequence is a block splice template which comprises two nucleic acid regions. The first region is located 3' of the second region and is blocked at its 3' terminus to inhibit primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Block splice template useful for amplification of nucleic acids - comprises two nucleic acid regions, the first region located 3' of the second region and blocked at its 3' terminus to inhibit primer extension
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 22 BP; 6 A; 6 C; 7 G; 3 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     recognised by acids, especia

                                                                                                                                                                                                  PCR primers (see AAV45541 and AAV45542) are designed for the PCR amplification of the Helicobacter pylori babB gene. The invention relates to recombinant DNA (see AAV62460-61) comprising a fusion gene prepared by ligating an antigenic determinant coding gene (e.g. the babB gene) of H. pylori and A2 and B subunit genes of Vibrio cholerae. Also claimed are chimeric proteins (see AAW80599-600) encoded by such recombinant DNAs, methods for the recombinant production of the chimeric proteins, and use of the chimeric proteins in preventative and therapeutic vaccines for H. pylori associated diseases such as gastritis, gastric ulcer, duodenal
                                                                                                                                                                                                                                                                                                                                                                      New chimeric proteins for use against Helicobacter pylori - comprising antigenic protein of H. pylori and Al and B subunits of Vibrio cholerae toxin, preferably produced by recombinant techniques.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               31-MAR-1997;

Claimed PCR primers (see AAT99462-T99531) hybridise to sequences that cencode the extracellular domain of human heat-stable toxin (ST) receptor protein (see AAW37371), a highly specific marker for metastasised colorectal cancer cells. PCR using these primers provides specific and sensitive detection of human ST receptor expression. A specific primer pair comprises the primers given in AAT99486 and AAT99487. Claimed in vitro methods for determining whether or not (i) an individual has metastasised colorectal cancer cells, or (ii) a tumour cell is a colorectal cancer cells, or (iii) a tumour cell is a colorectal cancer cells for tumour cell sensitive straintestinal tissue and/or body fluids or tumour cells from an individual to determine whether ST receptor protein is being expressed by cells in the sample. Expression is determined by immunoassay or by PCR using primers that selectively amplify ST receptor cDNA or mRNA (see also cancer colls and the sample of colorectal cancer cells amplify ST receptor cDNA or mRNA (see also cancer colls and colorectal cancer cells amplify ST receptor cDNA or mRNA (see also cancer cells and colorectal cancer cells amplify ST receptor cDNA or mRNA (see also cancer cells and colorectal cancer cells amplify ST receptor cDNA or mRNA (see
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Synthetic

PCR using these primers provides specific and sensitive detection of human ST receptor expression. A specific primer pair comprises the primers given in AAT99484 and AAT99485. Claimed in vitro methods for determining whether or not (i) an individual has metastasised colorectal cancer cells, or (ii) a tumour cell is a colorectal cancer cell comprise the steps of examining a sample of extraintestinal tissue and/or body fluids or tumour cells from an individual to determine whether ST receptor protein is being expressed by cells in the sample. Expression is determined by immunoassay or by PCR using primers that selectively amplify ST receptor CDNA or mRNA (see also AAT97229)
Determining whether an individual has metastasised colorectal cancer cells and origin of tumour cells - by detecting presence of heat-stal toxin receptor on cells in a sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Determining whether an individual has metastasised colorectal cancer cells and origin of tumour cells - by detecting presence of heat-stable toxin receptor on cells in a sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     03-MAY-1996;

encode the extracellular domain of human heat-stable toxin (ST) receptor protein (see AAW37371), a highly specific marker for metastasised colorectal cancer cells. PCR using these primers provides specific and sensitive detection of human ST receptor expression. A specific primer pair comprises the primers given in AAT99494 and AAT99495. Claimed in vitro methods for determining whether or not (i) an individual has metastasised colorectal cancer cells, or (ii) a tumour cell is a colorectal cancer cell comprise the steps of examining a sample of extraintestinal tissue and/or body fluids or tumour cells from an individual to determine whether ST receptor protein is being expressed by cells in the sample. Expression is determined by immunoassay or by PCR using primers that selectively amplify ST receptor cDNA or mRNA (see also AAT97229)

Determining whether an individual has cells and origin of tumour cells - by toxin receptor on cells in a sample. metastasised colorectal cancer detecting presence of heat-stat of heat-stable

14; Page 53; 62pp; English.

Claimed PCR primers (see AAT99462-T99531) hybridise to sequences that encode the extracellular domain of human heat-stable toxin (ST) receptor protein (see AAM37371), a highly specific marker for metastasised colorectal cancer cells. PCR using these primers provides specific and sensitive detection of human ST receptor expression. A specific primer pair comprises the primers given in AAT99490 and AAT99491. Claimed in vitro methods for determining whether or not (i) an individual has colorectal cancer receptor

Claimed in vitro methods for determining whether or not (i) an individual has metastasised colorectal cancer cells, or (ii) a tumour cell is a colorectal cancer cells, or (iii) a tumour cell is a colorectal cancer cells of examining a sample of extraintestinal tissue and/or body fluids or tumour cells from an individual to determine whether ST receptor protein is being expressed by cells in the sample. Expression is determined by immunoassay or by PCR using primers that selectively amplify ST receptor cDNA or mRNA (see also
                                                                                                                                                                                                                                                                                                                         Determining whether an individual has metastasised colorectal cancer cells and origin of tumour cells - by detecting presence of heat-statoxin receptor on cells in a sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           colorectal cancer cell comprise the steps of examining a sample of extraintestinal tissue and/or body fluids or tumour cells from an individual to determine whether ST receptor protein is being expressed cells in the sample. Expression is determined by immunoassay or by PCR

                                                                                                                                                                                                                                                                                                                                                                                                           protein (see AAW37371), a highly specific marker for metastasised colorectal cancer cells. PCR using these primers provides specific and sensitive detection of human ST receptor expression. A specific primer pair comprises the primers given in AAT99492 and AAT99493. Claimed in vitro methods for determining whether or not (i) an individual has metastasised colorectal cancer cells, or (ii) a tumour cell is a colorectal cancer cell comprise the steps of examining a sample of extraintestinal tissue and/or body fluids or tumour cells from an individual to determine whether ST receptor protein is being expressed by cells in the sample. Expression is determined by immunoassay or by PCR using primers that selectively amplify ST receptor cDNA or mRNA (see also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claimed PCR primers (see AAT99462-T99531) hybridise to sequences that encode the extracellular domain of human heat-stable toxin (ST) recep

These can be used as a method of detecting a mutation in the ATM gene by comparing the PCR products of amplification from a sample from a patient suspected of having an ATM mutation with a sample from a non-mutated ATM patient This method is especially useful for diagnosing ataxia telangiectasia in heterozygotes and can be used to locate the positions of the mutation. The diagnosis of ataxia telangiectasia in patients needing therapeutic radiation will prevent fatal radiation burns and the development of breast cancer which can occur

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ঠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The pGST97-delta-N238 primer was used with pGST97 reverse primer (CC (AAV16101) to amplify the corresponding fragments by PCR, using CC (Inearised pGST-UL97 as a template. The PCR product would encode for a CC glutathione-S-transferase (GST)- human cytomegalovirus (CMV) UL97 fusion CC protein in which the N-terminal region of the latter protein was CC truncated by 238 residues. Truncation of the N-terminal region of UL97 (CC protein kinase (see also AAV16100) and Carried out to CC investigate any changes in enzyme activity. It was determined that CC truncation of the first 303 N-terminal residues totally abolished CC enzymatic activity indicating that the N-terminal region was involved in CC kinase activity. The invention provides an assay method for the detection CC fagents that inhibit or enhance activity of the CMV UL97 protein CC kinase. GST-UL97 fusion protein confers an advantage in this method as it is more soluble, without loss of enzymatic activity, than UL97 protein. CC the invention claims that by using an optionally modified polypeptide which contains a UL97 phosphorylation consensus sequence, the assay contains that by using an optionally modified polypeptide which contains a UL97 phosphorylation consensus sequence, the assay contains that the variance of the compositions which can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

Therefore, the suppression is persistent and may involve any and all immunological mechanisms in effecting that suppression. Such a multifaceted response is more effective than the uni-dimensional suppression achieved by passive administration of monoclonal antibodies or extantderived regulatory T cell clones. PCR primers AAX81882-X81914 were used to amplify and analyse human TCR V beta genes, in the course of the
                                                                                                                                                                                                                                                                                                                                                                                                                       effective amounts of T cell receptor (TCR) peptides. The TCRs are present on the surface of T cells. The TCRs are chosen from V beta 6.2/3, V beta 6.6/5, V beta 6.7, V beta 2, V beta 5/1, V beta 7 or V beta 13. The V beta TCRs peptide-based vaccines are useful for prevention or treatment of multiple sclerosis. The presence of V beta 6.7 appears to be particularly associated with multiple sclerosis and can be used to determine an individual's susceptibility to multiple sclerosis. Vaccinating, rather

The invention provides polynucleotides corresponding to exon 2 and exon 3 of human leukocyte antigen (HLA) alleles HLA-B*3913, HLA-B*1406 and HLA-B*51 and exon 2 of HLA alleles HLA-DBB1*0820, HLA-DRB1*04 and HLA-DRB4*01. The polynucleotides are useful for typing the above HLA alleles in a sample, especially by a method that comprises (a) amplifying all/part of the relevant sequence using at least one primer pair; and (b) hybridizing the amplified product to a set of probes specifically hybridizing to target regions comprising one or more polymorphic nucleotides of the sequence, to determine the absence or presence of the

This invention describes novel oligonucleotides which are used for detecting the chemokines RANTES (regulated upon activation normal T expressed and secreted), macrophage inflammatory protein (MIP)-1 alpha or MIP-1 beta by (a) obtaining a sample possible containing RANTES or MIP-1 calpha or MIP-1 beta RNA, (b) performing an isothermal transcriptional camplification on the sample with 2 oligonucleotide primers, (c) detecting the product of step (b) where detection of a product indicates the presence of RANTES, MIP-1 alpha or MIP-1 beta in the sample. The assay is completed to determine the levels of the chemokines RANTES, MIP-1 alpha and the sample of the chemokines range. The assay is to be inhibitors of CD4+ T-cells by primary non-syncytium-inducing HIV-1 strains. Thus the level of expression of these genes can be used as prognostic markers for direct therapeutic management of HIV-infected patients. By being isothermic, the assay requires less manipulation by the experimenter. Also 'spiking' the sample with a known amount of control RNA allows quantitation and qualification of the products in a single assay. AAX88447-X88491 represent the primers and probes used inthe
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

Diagnostic kits for (a) typing the alleles comprising at least one preferred primer and/or at least one preferred probe and (b) for detecting the protein fragment encoded by the polynucleotides, comprising an antiserum or ligand (e.g. antibody) binding specifically to the protein fragment are provided. The polynucleotides also enable the isolation of the complete respective
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   RANTES; chemokine; detection; primer; probe; amplification; MIP-1 alpha; regulated upon activation normal T expressed and secreted; MIP-1 beta; macrophage inflammatory protein; CD4+ T-cell; inhibitor; prognosis; primary non-syncytium-inducing HIV-1 strain; therapy; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Detection of expression levels of the cytokines RANTES, MIP-lalpha MIP-lbeta used as prognostic markers of HIV-infected patients.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                22-JAN-1999;

                                                                                                                                                                                                         establishment of paternity. Kits containing the products of the invention provide many copies of selected RNA targets under conditions of constant temperature, ionic strength and pH. Specific amplification of RNA targets
                                                                                                                                                                                                                                                             This invention describes a novel method for the autocatalytic amplification of an RNA target in a transcription-based amplification system without thermalcycling. The method generates oligonucleotides for diagnostic or environmental testing, for use e.g. as probes and in cloning. Typical applications are the detection of genetic or infectious diseases, the monitoring of responses to therapy, the quantitation or detection of microorganisms in foods, forensic studies and the establishment of paternity.                                                                                                                                      श्
                                                                                                                                                                                                                                                            The present sequence represents a PCR primer for human APRIL (a CC proliferating inducing agent). APRIL is a member of the tumour necrosis CC factor family, and essentially free of normally associated proteins. CC APRIL and APRIL antibodies are useful in pharmaceutical compositions for preventing or reducing severity of an autoimmune disease or an immune CC response to tissue graft. The composition is also useful for stimulating the immune system, and treating cancer. APRIL is also CC useful for treating APRIL-related disorders by delivering via a vector (preferably viral vector) (gene therapy) into a mammalian (preferably CC human) cell. Labeled APRIL and fragments are useful for intifying APRIL CC receptors by screening compositions. Antisense DNA and antibodies and CC modified APRIL (preferably an anti-APRIL receptor antibody) are useful as blocking agents for inducing cell death by interfering with APRIL CC, and treats, suppresses or alters an immune response involving a signalling pathway between APRIL and its receptor (preferably involving a CC signalling pathway between APRIL and its receptors (preferably involving a CC also administered, and radiation therapy is also given to the patient is also administered, and radiation therapy is also given to the patient

                                                                                                                                                                                                                                                                                                                                                                                                This sequence represents a probe used to detect the coding region for a novel 3-hydroxyacyl-CoA dehydrogenase (hcd) from Staphylococcus aureus (AAX34393). The products can be used to prevent or treat bacterial infection, e.g. S. aureus infection or Helicobacter pylori infection. They can also be used for preventing invasion of bacteria in damaged tissue including wounds in skin or connective tissue caused, e.g. by mechanical, chemical, thermal or radiation damage or by implantation of indwelling devices, or wounds in the mucous membranes, such as the mouth the mucous membranes, such as the mouth the mucous membranes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to methods of determining a functional allele CC profile of a gene in a population. Functional allele profiles comprise the commonly occurring alleles in a population, and the relative CC trequencies at which such alleles of a given gene occur. The methods are CC used to identify and determine the frequency of the functional alleles of Genes which display extensive allelic heterogeneity, particularly those CC implicated in disease or conditions, such as the BRCA1 gene associated CC with breast cancer, CFTR associated with cystic fibrosis, dystrophin CC associated with Duchenne muscular dystrophy and Becker muscular GC dystrophy, and p53 associated with Li-fraumeni syndrome. The methods can CC also be employed for diseases where allelic and genetic heterogeneity CC exist, such as breast cancer, neurofibromatosis, and hereditary non-CC polyposis colorectal cancer. Identification of functional alleles is necessary for identification of mutations which may be implicated in the CC disease. Sequences AAX32001-172 represent primers for determining the functional allele profiles of various genes. The primers are specific for genes such as MSH2 gene, MLH1 gene, BRCA1 gene, BRCA2 gene and BAP1 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Best Local Similarity Matches 17; Conserv

                                                                                                                                                                                               product of the invention binds to RON (a cell membrane protein tyrosine kinase which is a member of the c-met family) to promote the formation of colon crypts. MSP analogues are useful for the treatment of conditions requiring the administration of MSP, such conditions include haematopoietic disorders such as those involving a deficiency of megakaryocytes and gastrointestinal disorders such as ulcerative colitis, Crohn's disease and infections. The MSP analogues are useful for cancer, where the aggressive use of chemotherapeutic agents or the use of cancer, where the aggressive use of chemotherapeutic agents or the use of whole body radiation may lead to gut toxicity. The MSP analogues, which have a higher activity than normal human MSP are effective at smaller dosages, or optionally, they may be administered less frequently than human MSP. This sequence represents a PCR primer used to amplify the human MSP described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention describes a novel purified and isolated analogue of mature macrophage stimulating protein (MSP) having at least one unpaired cysteine residue substituted with another amino acid which modulates the proliferation or differentiation of the intestinal epithelium. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CC fragments, at least one of which contains an ITR sequence, a region of CC the DNA fragment which contains at least one repeat unit consisting of a CC sequence of five, six or seven bases repeated in tandem at least two CC times; (b) providing a stationary support having at least one CC oligonucleotide associated with it, where the oligonucleotide includes a CC sequence of nucleotides which is complementary to a portion of the ITR CC sequence; and (c) combining the DNA fragments with the support under CC conditions where the DNA fragments including the DNA fragment containing CC used to isolate DNA containing pentanucleotide tandem repeat sequences as CC well as to detect target ITR DNA sequences having a low incidence of CC stutter artifacts (no more than 2.4%). The method is useful in DNA CC profiling for linkage analysis, criminal justice, paternity testing and CC other forensic and medical uses. DNA typing is also useful for confirming CC the lineage of horses, dogs and other prize animals. The invention CC overcomes problems related to the use of microsatellite loci in DNA CC profiling. The method can detect polymorphisms with a low incidence of the lineage of forest, which has previously been a repolation intermenting confirming.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  method to construct the complete turnip mosaic virus (TuWV) genome. The invention relates to the isolation of an infectious clone of TuWV. The clones, and vectors containing the plants, specifically Arabidopsis thaliana, for basic virological research and for expression of genes or epitopes of interest, particularly expression of animal virus epitopes for production of edible vaccines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 22

0,

PCR primers AAV83864-83 were used to amplify the coding region from the exons of the genomic DNA of tumour suppressor gene IB3089A, also known a DBCCR1 (Deleted in Bladder Cancer Chromosome Region candidate 1). The gene is located at 1932-33. Although the gene is expressed in multiple numan tissues, lack of expression of the gene was found in several bladder cancer cells. The DBCCR1 gene is involved in the development of

as

ells. The DBCCR1 probably by the

gene is ; deletion

DBCCR1 nucleic acid sequences are used for treatment or prevention of cancer, particularly bladder, ovarian or skin cancer, squamous carcinoma, renal cell carcinoma or squamous cell oseophageal carcinoma. The DBCCR1 protein can be used directly in the products can be used for diagnosis or prognosis of cancer, or to indicate prediaposition to cancer (including prenatal testing), particularly where this is associated with loss of heterozygosity at 932-33. Antibodies may also be used for affinity purification, therapeutically as modulator and to detect the protein in cells etc
The present invention describes genomic DNA which contains a BRCA2 gene where the first 12 nucleotides beginning exon 5 are 5'-TCCTGTTGTTC-3' a in sequence (I) (see AAX03249), where nucleotides numbers 5782-5790 are GTTTGTGTT as in sequence (IV) (see AAX30255), and where the last 20 nucleotides encoding exon 15 are 5'-CTGCGTGTTCTCATAAACAG-3' as in sequence (II) (see AAX30251) and the first 20 nucleotides beginning exor 16 are 5'-CTGTATACGCGTTTC-3' as in sequence (III) (see AAX30253). Products and methods from the present invention can be used for identifying mutations in the BRCA2 gene leading to predisposition or
                                                                                                                                                                                                                   New coding sequence haplotypes of the human BRCA2 gene - used to develop products for determining susceptibility to, detection and treatment of breast or ovarian cancer.
                                                                                                                                                                                                                                                                                                                                                Murphy PD,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              14-AUG-1998;

They can also be used for detection and gene therapy for breast and ovarian cancers. They can be used in methods for monitoring disease progression, for determining patients suited for gene and protein replacement progression, or for detecting the presence or quantifying the amount of a tumour growth inhibitor following such therapy. The BRCA2 protein, polypeptides, their functional equivalents, antibodies, and PNs may also be useful in the study of the characteristics of BRCA2 proteins, such as structure and function of BRCA2 in oncogenesis or subcellular localisation of BRCA2 protein in normal and cancerous cells. AAX33001 to AAX33097 represent PCR

the XLIS gene transcripts or to compare their sequence with that of the XLIS transcripts from patients for in vitro especially prenatal diagnosis of lissencephaly (LIS) (or agyria-pachygyria), subcortical laminar heterotopia (SCLH), cortical dysgenesis, cryptogenic epilepsies or neurodegenerative diseases such as Alzheimer's disease. These disorders mainly affect females as the XLIS gene is X-linked. The XLIS fragments may also be used to administer to patients to prevent or treat the above disorders and may be used as a tool in genetic counselling. This sequence is a primer for the human XLIS gene of the invention. The XLIS fragments may be used to detect abnormalities in the expression of the XLIS gene transcripts or to compare their sequence with that of the

AAX81831
                                                                               PCR primers AAX81830-31 were used to amplify human malignancy-associated gene (MAG) proteins. The polypeptide is useful for detecting antibodies associated with liver disease. Probes derived from the MAG gene are useful for detecting the presence of sequences associated with neoplastic disease, e.g. liver diseases such as cirrhosis and hepatocellular carcinoma, and therefore can be used in disease diagnosis. The sequences can be used for development of therapeutics that are useful for inhibition of the development of neoplastic liver disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 XIIS gene from a sample for comparison to normal samples in the in vitro diagnosis regime. This may also be performed by amplifying XIIS cDNA from the mRNA in the sample. Antibodies to XIIS may be used to detect XIIS in a biological sample or can be administered to patients to prevent or treat the above disorders. They may also be used to purify XIIS from a biological sample, XIIS may also be administered to patients to prevent or treat the above neurological disorders. In addition XIIS may be used or treat the above neurological disorders. In addition XIIS may be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAX81831;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         as a marker of neuronal cells at an early stage of development; its discovery increases understanding of both the neuronal movement which leads to development of the cortical region of the brain and of the pathogenesis of the group of neuronal disorders mentioned above
                                                                                                                                                                                                                                               Liver-associated malignancy-associated gene for cirrhosis and hepatocellular carcinoma.
                                                                                                                                                                                                                                                                                                                                                                               12-DEC-1997;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Homo sapiens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Liver neoplastic disease; malignancy-associated neoplastic disease; cirrhosis; hepatocellular ca
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The specification describes a liver neoplastic disease polynucleotide and malignancy-associated gene (MAG) proteins. The polypeptide is useful for detecting antibodies associated with liver disease, Probes derived from the MAG gene are useful for detecting the presence of sequences associated with neoplastic disease, e.g. liver diseases such as cirrhosis
                                                                                                                                                                                                         AAA99208;
                                                                                                                                                                                                                                                            AAA99208 standard; DNA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           associated with neoplastic disease, e.g. liver diseases such as cirrhosis and hepatocellular carcinoma, and therefore can be used in disease diagnosis. The sequences can be used for development of therapeutics that are useful for inhibition of the development of neoplastic liver disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Liver-associated malignancy-associated gene (MAG), for cirrhosis and hepatocellular carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Black K,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          12-DEC-1997;

Human CCR1 has anti-tumour activity, and can to produce a malignant tumour gene treating agent. The CCR9 gene and protein can be used for the diagnosis of the resistance of cancer cells against an anticancer agent. The method is useful in the genetic diagnosis of a diabetes patient. The method uses FPCR-SSCP (fluorescence-based polymerase chain reaction-single strand conformation polymorphism) for analyzing DNA samples for polymorphisms. Sequences AAZ39632-717 represent primers used for the FPCR-SSCP analysis of the human Vth aggregation factor gene
        referred as DBCCRI (Deleted in Bladder Cancer Chromosome Region candidate 1), and its promoter in a tumour suppressor region at 9932-33 between D9S1848 and AFMA239XA9 of human chromosome 99. The DBCCRI sequence can be used in the diagnostic, prophylactic and therapeutic treatment of cancer particularly bladder cancer. The promoter can be used to design DBCCRI amplifying primers and screen compounds that activate production of DBCCRI It can also be used in methods for determining inactivation of the DBCCRI gene in a patient, where inactivation indicates the presence of a tumour or a predisposition to cancer, especially a cancer associated with loss of heterozygosity involving 9932-33 e.g. bladder cancer, squamous carcinoma, skin cancer, renal cell carcinoma, oesophageal and ovarian cancers. The present sequence is a reverse primer SSCPex4 used to amplify exon 4 of IB3089A from the genomic DNA for SSCP (single-stranded conformational no light of the property of the present sequence is a reverse primer SSCPex4 used to amplify exon 4 of IB3089A from the genomic DNA for SSCP (single-stranded conformational no lights) and proverse primer sychematics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; tumour suppressor; IB3089A; cytostatic; promoter; 9q32-33; beleted in Bladder Cancer Chromosome Region candidate 1; DBCCR1; diagnostic; prophylactic; therapeutic treatment; cancer; skin; over bladder; squamous carcinoma; renal cell; oesophageal; PCR primer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       diagnostic; prophy bladder; squamous

                                                                                                                                     This invention describes a novel human G-protein coupled receptor protein capable of binding lysophosphatidic acid, and proteins derived from it by addition, deletion and/or substitution of one or more amino acid residues. Antibodies to the protein are used for diagnosis of, and agonists/antagonists to the protein are used for the treatment of, prostatic disorders such as prostate cancer, benign prostatic hyperplasia, and inflammation of the prostate. This sequence represents a primer used in the isolation of the human G protein-coupled receptor protein described in the method of the invention

                                                                                                                                                                                                                                                                    RESULT 3398
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention describes a novel method for determining an increased risk CC for thrombosis in an individual by determining the prothrombin level, or by detecting the presence or absence of a genetic mutation correlated with elevated prothrombin levels in individuals with the mutation, and where an increased prothrombin level indicates increased risk for CC thrombosis. INDEPENDENT CLAIMS are also included for the following: (1) a CC thrombosis comprising at least one primer which specifically hybridizes that for adjacent to the region of the prothrombin gene that contains a G to A CC mutation at position 20210, and suitable amplification reagents; and (2) an isolated polynucleotide comprising a mutated prothrombin gene, in CC which G at position 20210 is replaced by A, or a fragment of the gene which includes the G to A transition mutation at position 20210. The method is also used for screening and diagnosis of thrombophilia, CC especially, hereditary thrombophilia. AAAI1723-A11726 represent PCR CC primers used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                           Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               sequences. The Nurr1 protein is involved in the induction of tyrosine hydroxylase expression in adult rat-derived hippocampal progenitor cells. The Nurr1 gene and protein can be used in the treatment of catecholamine-related diseases such as Parkinson's disease, manic depression and schizophrenia. They can also be used to induce tyrosine hydroxylase expression and identify tyrosine hydroxylase related deficiencies, which are linked to the same diseases. The present sequence is a PCR primer used in a method to differentiate adult neural progenitor cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Cell comprising exogenous nucleic acid inducing tyrosine hydroxylase expression useful for treating catecholamine-related diseases such a
                          Inhibiting cell proliferation useful for cancer therapy, comprises administering Rad51 inhibitor in vivo.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This sequence represents an antisense inhibitor of human Rad51, designated AS6 (also referred to as R51AS6). The antisense inhibitors can be used in a method of the invention, for inhibiting cell proliferation. They can also be used in methods for inducing sensitivity to radiation and DNA damaging chemotherapeutics in an individual and in a method for prolonging survival in an individual with cancer. The methods and antisense molecules are useful for inhibiting cell proliferation, especially cancerous cell proliferation, for inducing sensitivity to radiation and DNA damaging chemotherapeutics in individuals and for prolonging survival in an individual with cancer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0
```

The present invention relates to loblolly pine polynucleotides with one or more Simple Sequence Repeats (SSRs) (see AAA74205-A74322). SSRs are also known as microsatellite Day Repeats. The SSRs are useful as genetic markers for genetic mapping, population genetics studies and inheritance studies in various plant breeding programmes. The present sequence is a PCR primer used for detecting the presence of a SSR locus in a pine

genomic DNA sample

                                                                                                                                                            The sequence represents the human Rad51 antisense oligonucleotide, AS6. The antisense oligonucleotide is used to study down-regulation of Rad51 protein in human brain, breast and prostate cells. Rad51 protein is defective in repair of damaged DNA, genetic recombination and the recombinational repair of DNA lesions, and plays a central role in cancer. Inhibiting cell proliferation involves administering to a cell a Rad51 antibody or its fragment. The Rad51 antibody or its fragment is useful for inhibiting cell proliferation, for treating disease states such as cancer, autoimmune disease, arthritis, graft rejection, inflammatory bowel disease, proliferation induced after medical procedures such as surgery, angioplasty etc. in humans and animals

                                                                                                                               The invention relates to antibody-based fusion proteins having one or more mutations in the junction between an immunoglobulin (Ig) and a no Ig moiety, which increases the circulating half-life of the fusion protein. The serum half-life of the mutant fusion protein is improved without affecting the interaction of the antibody moiety with the Fc receptor (FcR) and Fc protection receptor (FcRp). The antibody-based fusion proteins of the invention are useful to treat cancer, viral infections, immune disorders, and to enhance growth (including proliferation) of specific cell types. The present sequence is an oligonucleotide used for generating mutant humanised KS antibody (recognises epithelial cell adhesion molecule) and interleukin-2 fusion protein with Pro to Leu substitution at the fusion junction
                                                                                                            Sequence
                                                                                                                                                                                                                                                                                                                           Example
                                                                                                                                                                                                                                                                                                                                                   Antibody-based fusion protein comprises mutations near the fusion junction for enhancing circulating half-life.
                                                                                                                                                                                                                                                                                                                                                                                               WPI; 2001-514646/56.

                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a method for determining the ability of a test compound to alter the circadian rhythm of a mammal by its ability to alter phosphorylation or degradation of one or more period proteins. The present sequence is a PCR primer for one such period protein (rat PER1), that was used in the method of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Keesler G,

                                                                                                                 The present invention provides the protein and coding sequences of the human and rat metastasis-associated antigen C4.4A. The protein is expressed rarely in the adult, except on metastasising cancer cells. Because of this, the sequences are useful in cancer diagnosis and treatment of cell proliferation diseases. The present sequence is a PCR primer used to isolate the human C4.4A coding sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention provides the protein and coding sequences of the human and rat metastasis-associated antigen C4.4A. The protein is expressed rarely in the adult, except on metastasising cancer cells. Because of this, the sequences are useful in cancer diagnosis and treatment of cell proliferation diseases. The present sequence is a primer used to isolate the human C4.4A coding sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAF58878

                                                                                                                                                                                                                                                                                                                                                                                        밁
                                                                                                                                                                                                                                                                                                                                                                                                                  S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  immune response. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, haemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a Th2 to a Th1 immune response and to activate immune cells. Note: the present sequence aphosphorothioate backbone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        response. The method comprises administering an immunostimulatory nacid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Vaccinating against tumors, infe using immunostimulatory Py-rich
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (IOWA )

                         PCR primers AAH74499-AAH74500 were used to amplify a fragment of the pig genome, comprising the marker SW782. The primers were used in the method of the invention. The specification describes a method for determining if a pig is predisposed to a boar taint. The method comprises assaying for the presence of alleles conveying susceptibility to boar taint using genetic markers selected from SW1057, SW782, S0121, SW222 or regions of chromosome 6 spanning in between, or SW857, SW2496, SW295, SW210, S0007, SW761, SW1557 or regions of chromosome 14 spanning in between. The method is useful for determining the predisposition of pigs to boar taint which is a strong unpleasant odour given off upon heating or cooking of meat from uncastrated male pigs, and for exhibiting desirable flavour

                                                                                                                                                        PCR primers AAH74330-41 were used to amplify a fragment of the human ATIP gene. ATIP has isoforms designated hATIP2, hATIP3, hATIP4, hATIP5 and hATIP6. All ATIP proteins comprise in their C-terminals a common fragment which interacts with the angiotensin II (AT2) receptor. ATIP proteins have antionogenic functions. The human ATIP gene has 17 exons, and is have antionogenic functions. The human ATIP gene has 17 exons, and is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 22 BP; 6 A; 1 C; 9 G; 6 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                 PCR primers AAH78021-22 were used to amplify cDNA encoding a human alpha subunit of prolyl 4-hydroxylase, designated alpha (III) subunit. The alpha (III) subunit is useful for the production of recombinant collagen, and for the diagnosis, prevention and treatment of various diseases and disorders associated with decreased or increased production of the subunit in specific tissues. The polynucleotide is a source of probes and primers, which are useful for diagnosis, prevention and treatment of diseases and disorders associated with increased or decreased expression or activity of various prolyl 4-hydroxylase enzymes and to identify alpha or beta prolyl 4-hydroxylase or fragments in tissue, e.g. biopsies from specific tissues, etc or other biological samples. Small molecules that modulate, regulate and inhibit prolyl 4-hydroxylase activity are useful for treating and preventing kidney fibrosis and various other diseases

                                                                                                                                                                                                                                                                                                                                                                                                                                                            encoding them. The SECX polypeptides can be expressed by standard recombinant methodology. The SECX polypeptides are useful for treating or preventing a SECX-associated disorder. The invention is useful in screening assays; detection assays (e.g. chromosomal mapping, cell and tissue typing, forensic biology); predictive medicine (diagnostic assays, prognostic assays, monitoring clinical trials, and pharmocogenomics); and methods of treatment (e.g. therapeutic and prophylactic), especially disorders characterized by aberrant cell proliferation and/ or differentiation like cancer or immune associated disorders or gestational disease. Sequences AAC84904-906 represent primer-probe sets employed in the expression analysis of SEC1 clone

The method is useful for determining the expression of a protein and functional activity of a protein, which includes binding specificity, enzyme activity, stimulation of enzyme activity or stimulation of delta-polymerase activity. The protein is especially human or Drosophila melanogaster proliferating cell nuclear antigen (PCNA). Metal charged IDAC allows easy screening of a large number of proteins following mutagenesis and can rapidly ascertain which mutants have desired functional activity or binding capacity. The present

New transgenic mice, useful as non-human mammalian models of human disease, comprise recombination activation gene mutations and donor specific transgenes encoding cytokines.

CC both alleles of a gene activated in early lymphocyte development are conditional activated in early lymphocyte development are conditional activated in early lymphocyte development are conditional activation gene-2 (RAG-2) gene are conditional activational gene-2 (RAG-2) gene activational generate the conditional generate generate the conditional generate generate fully human polyclonal conditional antibodies to generate fully human polyclonal conditional generate generate generate the generate the generate the generate the generate the conditional generate generate generate the generate ge immunologically dysfunctional. In addition the transgenic mouse provides a unique model system which supports T cell development in a manner which more closely resembles normal ontogeny, as they possess CD4+ T cells in the periphery that exhibit MHC-restricted antigen- specific responses. Sequences AAF76133-AAF76192 represent human cytokine PCR primers used in the development of human cytokine-expressing transgenic mice The invention relates to a transgenic immunodeficient recipient mouse which is capable of supporting the growth of donor cells. In the mous the mouse,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is given in a specification relating to an isolated and purified nucleic acid encoding a biologically active methionine adenosyltransferase II (MAT II) beta subunit polypeptide capable of modulating MAT II biological activity. The MATT II beta subunit nucleic acid and polypeptide are useful in screening assays for identifying compounds that affect or modulate MATT II biological activity. The MATT II beta subunit polypeptides have utility as feed additives for livestock. The MATT II beta subunit polypeptide, anti-MATT II beta subunit antibody and antisense oligonucleotide are useful for treating a disorder associated with MAT II biological activity. e.g. cancer,

The tumour suppressor genes play a major role in the pathogenesis of human lung cancer and other cancers. The polypeptide and polynucleotides are useful for detecting, diagnosing and treating various human cancers. These are particularly useful for inhibiting human cancers.
                                                                                                                                                                                                                                                                                                                                                                                                  Human; G protein-coupled receptor; antidiabetic; anorectic; cytostatic; immunomodulator; neuroprotective; notropic; antiparkinsonian; metabolic immunosuppressive; ophthalmological; antibacterial; virucide; fungicide; protozoacide; hypertensive; hypotensive; analgesic; osteopathic; antilizer; antiatethmatic; antiallergic; anti-HIV; antilipaemic; vaccine; antiinfertility; antiinflammatory; haemostatic; cell signal processing; cardiomyopathy; atherosclerosis; metabolic pathway modulation; cancer; gene therapy; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            tumourigenicity, suppressing tumour or restricting metastatic processes in various tumours such as lung, colon, breast, stomach, cervix, and head and neck, prostate or pancreas. In particular, the cancer is brain cancer, lung cancer, letter cancer, spleen cancer, kidney cancer, lymph node cancer, small intestine cancer, blood cell cancer, pancreatic cancer, colon cancer, stomach cancer, cervix cancer, breast cancer, endometrial cancer, stomach cancer, testicle cancer, ovarian cancer, skin cancer, head and neck cancer, esophageal cancer, ovarian cancer or bone marrow cancer. The present sequence represents a primer for detecting an unmethylated RASSFIA promoter fragment by methylation-

The GPCRs can have activities such as: antidiabetic; anorectic; immunomodulator; cytostatic;

CC antiasthmatic; antilipaemic; antiallergic; antiinfertility; haemostatic; cc antiasthmatic; antilipaemic; antiallergic; antiinfertility; haemostatic; cc and antiinfelammatory. They can be used in gene therapy and vaccine production. The GPCR proteins can be used for treating or preventing GPCR cc -associated disorders such as cardiomyopathy, atherosclerosis, or a cc disorder related to cell signal processing and metabolic pathway cm modulation, in humans. GPCR proteins and the polynucleotides encoding cc disease, especially cancer associated with altered levels of GPCR croteins and polynucleotides, by measuring the level of protein GCC expression or the amount of nucleic acid from a mammal and comparing it composition are also useful for identifying an agent, especially cellular cc proteins are also useful for identifying an agent, especially cellular cc candidate substance interacting with an olfactory receptor or screening of a cc andidate substance interacting with an olfactory receptor polypeptide, its fragments or variants. The present sequence represents a PCR primer cc used in the isolation of a novel human GPCR in the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes novel human G protein-coupled receptors (GPCR) designated GPCR1-36 from the present invention. The GPCRs can have activities such as: antidiabetic; anorectic; immunomodulator; cytostatic; neuroprotective; nootropic; antiparkinsonian; analgesic; osteopathic; immunosuppressive; metabolic; ophthalmological; antibacterial; virucide; fungicide; protozoacide; hypertensive: hypertensive:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      07-AUG-2000;

                                                                                                                               CC polypeptides and polynucleotides. The GPCR polypeptide, GPCR nucleic acid CC and antibody are useful for treating, preventing or alleviating a GPCR-CC associated disorder or a pathological state in a subject, particularly a CC human. In particular, the disorder is cardiomyopathy, atherosclerosis, CC diabetes, or a disorder related to cell signal processing and metabolic comparts of the presence of or predisposition to a disease associated cC pathway modulation. The GPCR polypeptide and nucleic acid are also useful cC for diagnosing the presence of or predisposition to a disease associated cC with altered levels of GPCR, particularly cancer. The GPCR nucleic acid capilications for disorders associated with aberrant GPCR expression or activity. The DNA encoding the protein is useful in gene therapy for CC treating the above conditions. Furthermore, the nucleic acids and CC polypeptides are useful in treating adenocarcinoma. lymphoma, prostate cancer, uterus cancer, immune response, neurodegenerative disorders, Cabrima, inflammatory disorders, Crohn's disease, multiple sclerosis or CC astright hereditary osteodystrophy. These are also useful in developing a powerful assay system for functional analysis of various human disorders, CBCPB_Coding_series and arches of the investion thuman disorders.

                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method for inhibiting or reducing tumour cell proliferation in an individual in vivo. The method comprising contacting a tumour cell in vivo with a Rad51 inhibitor and a polynucleotide capable of expressing functional p53 protein. The method is useful for inhibiting or reducing tumour cell proliferation in an individual in vivo. The method is useful for treating hyperproliferative disorders, especially cancer (such as Hodgkin's disease, squamous cell carcinoma and leukaemia), premature aging, autoimmune disease, arthritis, graft rejection, inflammatory bowel disease, and proliferation induced after medical procedures such as surgery and angioplasty. The invention is useful in gene therapy. The present sequence is an antisense oligonucleotide used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Tumour cell proliferation; Rad51 inhibitor; p53 protein; premature aging; hyperproliferative disorder; Hodgkin's disease; squamous cell carcinoma; leukaemia; autoimmune disease; cancer; graft rejection; angioplasty; inflammatory bowel disease; immunosuppressive; gene therapy; arthritis; antisense; phosphorothicate backbone; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Inhibiting/reducing tumor cell proliferation in individual in vivo, for treating cancer, arthritis, involves contacting tumor cell in vivo with Rad51 inhibitor, and polynucleotide expressing functional p53 protein.
                                                                                                                                                                                                                                                                                                                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Disclosure; Page 5; 12pp; English.

The composition is useful for enhancing an immune response or inducing cytokines. It can be used as a vaccine adjuvant and in treating diseases, including pathogenic infection, (non-)malignant tumours (e.g. cancers of the brain, lung, ovary, breast, prostate or colon, or carcinomas and sarcomas), autoimmune diseases or allergies (e.g. allergic rhinitis, hay fever or food allergies). Lyme disease, preventing or ameliorating, the symptoms resulting from exposure to a biowarfare agent, e.g. Ebola, Anthrax or Listeria. The present sequence is an immunostimulatory oligonucleotide described in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New immunostimulatory compositions comprising RNA/DNA hybrid oligonuclectides, useful for enhancing an immune response or cytokines, particularly for treating diseases, e.g. cancer, s HIV infection.

The method is useful for evaluating a lung cell sample of a lung cancer patient. The method is useful for determining the prognosis of a lung cancer and for assessing a lung cancer for a tendency to metastasise, where decreased expression of a WNT gene or HOXAl gene, or increased expression of HOX gene other than HOXAl, or both, indicates poor prognosis, increased rate of tumour growth, and increased tendency to metastasise. The method is useful for obtaining data for diagnosis, to determine clinical prognosis, including rate of growth, tendency to metastasise to assess the efficacy of treatment and to determine the efficacy of a therapeutic agent. The present sequence is a real time (RT)-PCR primer used to amplify FGF10. This sequence is used in the expendition of the author of the present sequence is a real time (RT)-PCR primer used to amplify FGF10.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to inhibiting angiogenesis in a subject, comprising administering at least one antiangiogenic nucleic acid molecule. Also included is a kit comprising a first container housing the antiangiogenic nucleic acids, and instructions for administering them to a subject having a condition characterised by unwanted angiogenesis. The method is useful for inhibiting angiogenesis associated with solid tumour growth, tumour metastasis, precancerous lesion, rheumatoid arthritis, psoriasis, diabetic retinopathy, retnopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, rubcosis, Osler-Webber Syndrome, myocardial angiogenesis, plaque meovascularisation, telangiectasia, haemophiliac joints, angiofibroma, wound granulation, intestinal adhesions, atherosclerosis, scleroderma and hypertrophic scars. The present sequence is an antiangiogenic nucleic acid of the invention

The invention also relates to a method for transforming a leguminous plant by introducing to a leguminous plant cell, tissue or organ, an isolated nucleic acid molecule comprising an SU promoter or a 350 promoter operably linked to a nucleic acid encoding a virus-encoded coat protein and regenerating a transformed leguminous plant from the plant cell, tissue or organ, where the transformed leguminous plant is immune to a pathogenic plant virus. The method is useful for producing a leguminous plant with enhanced viral resistance by crossing two parent plants each having enhanced viral resistance or immunity against one or more different viruses. This sequence represents a reverse transcriptase PCR (RT-PCR) primer used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Conferring immunity to pathogenic plant virus on leguminous plant by introducing nucleic acid sequence encoding virus-encoded coat protein, dysfunctional viral replicase or iRNA comprising hairpin RNA, to plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        01-AUG-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Bcr/abl forward PCR primer used in whole cell RT-PCR.

The present sequence is that of a bcr/abl forward PCR primer. The primer CC was used in an example from the invention demonstrating the inhibition of CC RNase enzymes in RT-PCR reactions using polyg or polyI attached to CC resins. RT-PCR was conducted without prior RNA isolation using K562 CC (human erythroleukaemia cell line) whole cell lysates. The reverse primer CC for the PCR is given in ABNG4450, Results were compared with the effect CC of adding RNASIN ribonuclease inhibitor. Addition of RNASIN to cells CC during lysis allowed for the sensitive detection of the bcr/abl signal CC down to as low as I cell, with increasing signal intensity with CC increasing cell number. The addition of 1 ul, but not 3 ul, of polyG CC cells (with or without spin). The signal in the presence of polyG wase than with RNASIN. It is concluded that RNA polymers can replace CC RNASIN in single-tube, whole cell RT-PCR. The example illustrates the CC present invention, which relates to compositions and methods for using CC RNA polymers to inhibit RNase enzymes (e.g. those involved in CC angiogenesis such as in tumour growth and proliferation, and in other CC involved in disease states
